

SyncDog is the first endpoint security solution designed to manage mobile data

SyncDog is the first endpoint security solution designed to manage mobile data, not mobile devices. Employing the highest levels of data encryption and containerization, the SyncDog Trusted Mobile Workspace (TMW) creates a highly secure work area on any mobile device – regardless if company owned (COPE) or personally owned (BYOD) – that isolates all work-related email, apps and data from personal use on the same device. No intrusive MDM agents are required.

Data Encryption and Containerization:

The TMW employs Department of Defense advanced data encryption and containerization techniques that ensure work-related email, applications, and data are isolated from personal use on the same device, thus safeguarding sensitive information.

Security without MDM Agents:

Unlike traditional Mobile Device Management (MDM) solutions that often require intrusive agent installations on devices, SyncDog's solution does not rely on such agents. This ensures that personal data remains separate and private, all while maintaining corporate data security.

Security vs. Usability Resolution:

SyncDog bridges the gap between security and usability that arises when employees want to use a single device for both work and personal activities. This eliminates the need for carrying multiple devices and respects the privacy of the device owner in a BYOD environment.

Zero Trust Endpoint Security:

The TMW is a true "Zero Trust" solution, providing a strict security approach where no entity, whether inside or outside the organization, is inherently trusted. This ensures all work-related email, data and apps are fully encrypted on the device (at rest) and while sending and receiving from the device (in transit) using Validated FIPS 140-2 cert. AES 256-bit encryption.

End-to-End Data Loss Protection (DLP):

The TMW offers comprehensive Data Loss Protection by ensuring that work-related email, data, and applications are fully encrypted both when stored on the device and when being transmitted.

Support for Various Industries:

A wide range of industries, including Government, Financial, Healthcare, Military, Insurance, Manufacturing, and many others are leveraging the SyncDog platform to ensure their data is always safe.

Single Application Installation:

SyncDog offers an easy-to-install single application for managing the entire suite of work-related solutions. This centralized approach simplifies the deployment and management process for IT administrators.

Privacy Assurance:

Employees can have increased confidence in using their personal devices for work, as the TMW separates work-related functions from personal apps and information. This solves the BYOD dilemma between privacy and data access by employers.

Compatible with Both COPE and BYOD:

The solution is designed to work with both Company-Owned Personally Enabled (COPE) and Bring Your Own Device (BYOD) devices, offering flexibility for organizations with varying device management approaches.

Suitable for Security-Conscious Organizations:

Organizations that prioritize the security of their data—especially those dealing with sensitive information like government agencies, financial institutions, healthcare providers, and the military—are assured of the that their sensitive data is secure and encrypted.

The SyncDog Trusted Mobile Workspace provides a comprehensive solution to the challenges of securing mobile working environments. Our emphasis on data encryption, containerization, zero trust, and privacy preservation makes it the perfect mobile security option for organizations looking to balance security, usability, and personal privacy for mobile devices.
